2005
Electrical Network
Substations

- 220 kV: 94%
- 110 kV: 5%
- 34.5 kV: 5%
Situation in March 2005

- 11 inefficient big thermoelectric plants, with 25 years average of work, a 60% off availability, frequently failures and high incomes.

- Frequently Blackouts in the hours of maximum demand (peak load).

- High % of electrical losses in power Transmittance and Distribution lines.
Strategy

- New power generation distributed all over the country.
- Rehabilitation off the networks.
- Energy saving programs in the whole country supported by the government and Regulation off industrial loads at the hours off maximum demand.
- Use and develop of renewable energy source.
NEW CONCEPTS FOR THE DEVELOPMENT OF THE ELECTROENERGETIC SYSTEM FOR DISTRIBUTED GENERATION OF ENERGY IN CUBA

- LOW CONSUME OF OIL.
- MORE THAN 90% AVAILABLE AT ANY TIME.
- POSSIBILITY OF FAST START THAT MAKE POSSIBLE GET FACE MORE EFFICIENTLY TO PEAKS DEMANDS.
- REDUCTION OF ELECTRICAL LOSSES
Implementation of a wide program of networks rehabilitation

- The process of rehabilitation of networks has begun in order to reduce loss in distribution and eliminate low voltage levels in consumers.
- The production of distribution transformers will be triplicated.
- New brigades of linesmen are being formed in the whole country.
Implementation of a wide program of networks rehabilitation

- The technical conditions of the installed transformers will be checked. Electric posts and leads in bad conditions will be replaced.

- Modern and efficient fleet of transports for the improvement of the service provided by our linesmen (trucks, cranes, and specialized vehicles.)

- Resources will be dedicated to keep the level of availability of the most efficient units of the current thermoelectrical plants.
Situation in February 2006

• More than 300 MW in new Diesel Groups were installed and synchronized with the power grid.

• A reduction off the maximum demand (peak) in more than 200 MW was obtained with the energy saving program.

• No Blackouts since december 2005.
Energy Efficiency and Renewable Energy Experience in Cuba
Energy-Saving Project:

“Replacement of incandescent lightbulbs with energy-saving bulbs”
BENEFITS

• The energy-saving lightbulb provides the same amount of light and spends 80% less electricity than the incandescent one.

• The energy-saving lightbulb last 5-6 times more than the incandescent one.

• The energy-saving lightbulb does not generate heat, because almost all the electricity it consumes is used to produce light.
• According to our experience in Cuba, for every 1 million incandescent lightbulbs replaced with energy-saving bulbs in less than a month, the country’s daily consumption is reduced, on average, by 240 MWh. Thanks to this, 48 tons of oil are kept from burning immediately and US$ 14,400 is saved every day.

• This project has also impacted households because for every lightbulb changed the monthly consumption is reduced, on average, by 5.7 kWh.
• According to Cuba’s experience, for every 1 million incandescent lightbulbs replaced with energy-saving bulbs, there is an average reduction of 25 MW of demand during the night-time peak, thus making it possible to stop generating power on the most inefficient generation blocks and enabling the country to refrain from more costly and slow-moving investments on new units.

• In only one year, 8 million of incandescent bulbs were changed in Cuba, reducing in 200 MW the maximum demand (peak).
Other Energy Saving Projects in execution in Cuba.

• Efficient household electrical appliances are being distributed in order to improve the living standards of the population. High energy consumption appliances are being replaced all over the country in a very fast way.
Other Energy Saving Projects in execution in Cuba.

In the Industrial sector we are doing a lot of projects such as:

- Replacement of inefficient lighting.
- Replacement of water pumps, motors, for efficient ones.
- Compensation of power factor with capacitors in the consumers.
- Displacement of loads from the peak demand to midnight.
AN ESSENTIAL AIM IN OUR ENERGY REVOLUTION IS TO CREATE A NEW ENERGY SAVING CULTURE IN THE CUBAN SOCIETY

• In all educational levels, teachers gave childrens subjects about Rational Use of Energy and care off the environment.

• Kids with the supervision of teachers make drawings, paintings, narrations and have a competition in order to select the best works related to energy saving programs.

• Regulations guarantee that only efficient appliances commercialize in Cuba.

• Electrical tariff was changed in order to stimulate that families save energy.
AN ESSENTIAL AIM IN OUR ENERGY REVOLUTION IS TO CREATE A NEW ENERGY SAVING CULTURE IN THE CUBAN SOCIETY

• Campaigns are carried out in order to promote an awareness of energy saving in the present and future generations.
